When a connection fails to connect to the database server, the following log messages are displayed in the active log file: [1] LOG: closing log file: .XXXXXX [2] FATAL: database file "c:\Program Files\MySQL\MySQL Server 5.6\MySQL\mysql-bin.log" has been altered For example, the following situation causes a connection to fail to complete, but no error log messages are generated: mysql> GRANT ALL PRIVILEGES ON *.* TO 'root'@'localhost' IDENTIFIED BY 'password'; ERROR 1054 (42S22): Unknown host 'localhost', server 'localhost:3306' In this example, the error log file contains the following: ERROR 1054 (42S22): Unknown host 'localhost', server 'localhost:3306' In this case, MySQL reported the error message of ERROR 1054 (42S22): Unknown host 'localhost', server 'localhost:3306' in the error log file when the error occurred. By Default, Server-Logging Is Disabled When the --log-bin option is used when starting MySQL Server, the active log file is created and the server-logging flag is enabled. In this case, the server-logging option determines whether the server-logging active log file is enabled or not. (The server-logging flag is enabled by default; change the server log flag with the --log-bin option.) The server logs the error message in the error log file when a connection fails and the following two conditions are met: --log-bin = FILE or --log-bin=FILE

Any individual can contribute to a product, but what it takes to be a successful product in the marketplace can be hard for an individual. There are several different angles to look at this conundrum of devising products, as there are different angles to any great question. As you have heard from Calvin Moo and Adam Ferrier, the question of the changes in the market can be handled very differently depending on the situation. For example, if you have a product where the customers demand a paradigm shift in the way products are constructed and you do not have the resources available to undertake the change, you may decide to become independent. There are others, who decide to reinvent the wheel and create something new. The new products are developed for a customer segment, whose desires are not taken into consideration when designing the products. The way a product is developed is determined by the business model of the organization. It also has an effect on the market. Some products make more sense for the market, whereas others need more time to be viable. There are products that are so revolutionary that they take a decade to materialize. Sometimes products are so revolutionary, that they get shelved before they are ready to give consumers what they want. Where to go with your idea? Another question, is what happens if your idea is shelved? In most cases a person can either decide to accept that the idea is shelved, or they can take an alternative view and forge ahead. This alternative view is based on the fact that there are alternatives. There Occ13bf012

With the advancement of the GPU hardware and its ability to handle multiple software simultaneously, we're seeing more and more non-gaming users develop their first computer. It is becoming more and more common for the needs of a workstation to blur with the demands of a gaming PC. Often, these mixed users have no clue how to find a balance and choose the best desktop to get the most out of it. The PC Answer to this problem is; how long is too long, for the longevity of the computer? The first issue most people have in mind when it comes to budget and power is RAM. At a bare minimum, users should require 3 GB of RAM to run a single application with some processing capability. The second is HDD space. Most new PCs are offered with 5-600 GB of hard drive space, but that is just for storage of user files, preinstalled programs and miscellaneous documents. If you really want to move some files around and install a fresh OS, then your computers hard disk space will be eaten up by at least 10 GB. To clarify, most of these needs can be filled with the amount of DDR3 RAM (in ECC) the computer is sold with. There are a few exceptions; systems with older versions of Windows (Windows XP, Vista, 7 and 8) only offer 2 GB of RAM and there are still a lot of people that have spare RAM lying around from an older desktop computer. The other focus that people struggle with is power. With most of today's CPUs, users will be able to run up to 10 applications all the time. They can all be running in the background, even if only one is open at a time. Windows 7 comes with the ability to suspend as many applications, even if only one is open, with the task manager. What happens when you put 10 applications on a processor? It will run them, but it might need to give your PC some help
